

Bootstrap-Scrollspy

The Bootstrap scrollspy is a navigation mechanism that automatically highlights the nav links based on the scroll position to indicate the visitor where they are currently on the page.

The scrollspy will make your web page more elegant and accessible, if you're using the bookmark links for directing the visitors to the different sections of a page that has a huge amount of content.

Scrollspy has the following requirements to function properly:

- It must be used on a Bootstrap nav, or list group component.
- You must apply the style `position: relative;` on the element you're spying on, which is usually the `<body>` element. But, if you're spying a `<div>` or any element other than the `<body>` be sure to additionally apply a `height` and `overflow-y: scroll;` on it.
- Anchors (`<a>`) are required and must point to an element with that id.

Add `data-bs-spy="scroll"` to the element that should be used as the scrollable area (often this is the `<body>` element).

Then add the `data-bs-target` attribute with a value of the id or the class name of the navigation bar (`.navbar`). This is to make sure that the navbar is connected with the scrollable area.

Note that scrollable elements must match the ID of the links inside the navbar's list items (`<div id="section1">` matches ``).

The optional `data-bs-offset` attribute specifies the number of pixels to offset from top when calculating the position of scroll. This is useful when you feel that the links inside the navbar changes the active state too soon or too early when jumping to the scrollable elements. Default is 10 pixels.

Example:
